Contents

Preface

Welcome to the jobsworth project management, support ticketing and CRM system. This software is licensed under the AGPLv3.

Jobsworth can be used for helpdesk support ticketing, customer liasion, resource management (eg. systems and password tracking) and has a range of CRM type functionality. Plan your projects, see your schedule, know if you're slipping behind and why. Time Tracking and extensive reports help you show your clients exactly what you've done and for how long.

- no restrictions or limits
- interactive gantt chart & scheduling
- flexible reporting
- tracks and indexes all changes
- notifications via email, rss & ical
- ldap integration
- acounting / billing system integration
- custom attributes
- inbound and outbound email integration
- sophisticated access control
- services (SLA)
- resources
- .. much much more

Further project details can be seen at Ohloh (https://www.ohloh.net/p/jobsworth) .

Support

The primary support is through the mailing list (https://groups.google.com/forum/#!forum/jobsworth) or if you have a bug report, create an issue (https://github.com/ari/jobsworth/issues) in the tracker. If you want to write up details of a new feature you'd like to see, please use the wiki wiki (https://github.com/ari/jobsworth/wiki) .

Contributing

Code contributions are welcome to this project and the best way to go about it is to fork the git repository:

```
https://github.com/ari/jobsworth
```

Please read the DEVELOPMENT.md file in this directory for more information. Join the developer mailing list (https://groups.google.com/forum/#!forum/jobsworth-dev) ↗ to discuss ideas or ask questions.

I Installation

1 base OS installation

The base installation of Jobsworth 4.0 is very easy (big improvement to previous releases), once a server with some SQL-database and a servlet container has been set up. For those of you not setting up such servers frequently, I have added some more screenshots and commands, that might help you speeding up the installation process.

Note

The following installation instructions are based on FreeBSD® 9.2. Other Unix-like operating systems may also work, once a LAMP server has been set up. Especially pathes to configuration files differ in various distributions from Free-BSD® and have to be adapted individually.

First of all get an operating system on a dedicated machine running. Typically Jobsworth only uses server functionality, therefore a graphical user interface (e.g. Gnome or KDE) is not necessary. If you are new to server installation, such GUI would help you to find your way around (e.g. looking on the web for HowTo's).

2 Database

Install the database-server package. You can either use mysql or postgresql. The following example shows the setup of *mysql* . After invoking mysql from the command-line you should see a screen like this:

```
$ mysql
Welcome to the MySQL monitor. Commands end with -; or \g.
Your MySQL connection id is 6
Server version: 5.5.33 Source distribution

Copyright (c) 2000, 2013, Oracle and/or its affiliates. All rigths reserved.
Oracle is a registered trademark of Oracle Corporation and/or its
affiliates. Other names may be trademarks of their respective
owners.

Type -'help;' or -'\h' for help. Type -'\c' to clear current input statement.

mysql>
```

> ⚠️ **Important**
>
> If you see any minus-signs in the screenshot above: This is some unresolved rendering error problem (for PDFs only?). Be aware that those minus-signs shall NOT be typed as part of the configuration scripts that will follow.

Now type in the following commands to create the jobsworth database and an admin-user. Feel free to adjust database-name, user-id and password and note it for later configuration. Then quit mysql-console.

```
CREATE DATABASE mydb DEFAULT CHARACTER SET utf8
CREATE USER -'monty'@'localhost' IDENTIFIED BY -'some_pass';
GRANT ALL PRIVILEGES ON *.* TO -'monty'@'localhost' WITH GRANT OPTION
quit
```

Note

At a later stage in this installation process Jobsworth will setup all tables and initial data on its first call.

To enable the start of mysql during start of your server, the following entry has to be inserted into your startup configuration file (e.g. /etc/rc.conf)

```
mysql_enable="YES"
```

3 Apache

Installation of Apache Web-Server on most OS distributions is pretty straightforward. Just install the packages delivered with your distribution. For this example I have installed Apache V2.2.

To enable the start of Apache Web-Server during start of your server, the following entry (depending on your OS and apache version) has to be inserted into your startup configuration file (e.g. /etc/rc.conf)

```
apache22_enable="YES"
```

In any browser type in the URL of your Jobsworth server. For example:

```
http://172.20.50.4
```

A simple screen shows, that Apache is running.
FIGURE 3.1: APACHE WORKS

4 Servlet container

Install Apache Tomcat (or another java servlet container) and make sure you can get to the default installation home page. How to install Tomcat or some other servlet container is beyond the scope of these instructions (still, some more details will follow here) but the basic details can be found in the documentation (http://tomcat.apache.org/tomcat-7.0-doc/) ↗ . Don't be afraid of all those XML configuration files in Tomcat; mostly they can be left to default values.

There is one file you will need to edit and that is context.xml. This file defines all the configuration for your application. Copy the example (https://github.com/ari/jobsworth/blob/master/config/context.example.xml) ↗ into the tomcat configuration folder and set all the variables to reasonable choices for your system.

> ⚠️ **Important**
>
> Please note that line-breaks in the following listing might be confusing. Always load actual context.example.xml (https://github.com/ari/jobsworth/blob/master/config/context.example.xml) ↗ file for your reference!

```
<?xml version="1.0" encoding="UTF-8"?>
<!--
This file is an example. You will need to customise it for your own needs, and
rename it
to context.xml. In Apache Tomcat is belongs inside a folder called -"config".  ❶

You can change the mysql driver to postgresql and you will need to replace all the
variables
which look like this ${VARIABLE} either at runtime using a script, or by editing
this file
directly.
-->

<Context swallowOutput="true">
  <Resource name="jdbc/jobsworth"
            removeAbandoned="true"
```

```
            auth="Container" type="javax.sql.DataSource"
            maxActive="100" maxIdle="30" maxWait="10000"
            username="${DBUSER}" password="${DBPASS}" ❷
            driverClassName="com.mysql.jdbc.Driver" batchSize="-1"
            url="jdbc:mysql://${DBSERVER}:3306/${DBNAME}? ❸
autoReconnect=true&zeroDateTimeBehavior=convertToNull&useUnicode=true&characterEncoding=utf8"
            validationQuery="select 1"/>

  <!-- The base domain of the running application. The actual URL you use to
access the system is the name of the tenant followed by this. So you might
have -'company1.acme.com' and -'company2.acme.com' -->
  <Parameter name="config.domain" value="acme.com" override="false"/>

  <!-- Jobsworth can be branded as something else -->
  <Parameter name="config.productName" value="jobsworth" override="false"/>

  <!-- SSL is good. But you may want to turn it off while you are first setting
this up -->
  <Parameter name="config.ssl" value="true" override="false"/>

  <!-- A path to a folder on disk where jobsworth will store task attachments -->
  <Parameter name="config.storeroot" value="/var/jobsworth/assets" override="false"/
>

  <!-- What domain will mail from jobsworth come from? -->
  <Parameter name="config.email_domain" value="acme.com" override="false"/>

  <!-- Some emails like password resets will come from this user name. So in this
example, it will be jobsworth@acme.com -->
  <Parameter name="config.email_replyto" value="jobsworth" override="false"/>

  <!-- The from user name. This is usually the same as the reply-to username -->
  <Parameter name="config.email_from" value="jobsworth" override="false"/>

  <!-- Something to put at the start of every subject on emails from jobsworth -->
  <Parameter name="config.email_prefix" value="'[jobsworth]'" override="false"/>
```

```
  <!-- Jobsworth SMTP settings ---> ❹
  <Parameter name="config.smtp_host" value="mail.acme.com" override="false"/>
  <Parameter name="config.smtp_port" value="25" override="false"/>
  <Parameter name="config.smtp_domain" value="acme.com" override="false"/>

  <!-- This value is used for integration with your incoming mail server. Change
it! --->
  <Parameter name="config.secret" value="changeThisValueToSomethingRandom"
override="false"/>

  <!-- Jobsworth email notification of errors --->
  <Parameter name="config.error_email_prefix" value="'[jobsworth error]'"
override="false"/>
  <Parameter name="config.error_sender_address" value="jobsworth@acme.com"
override="false"/>
  <Parameter name="config.error_exception_recipients"
value="['support@example.com','sysadmin@example.com']" override="false"/>

</Context>
```

❶   If you are unsure, which "config" folder: search for a folder containing a subfolder "ROOT".
    It most probably is close to this. On my FreeBSD installation the config folder is located at:

```
/usr/local/apache-tomcat-7.0/conf
```

❷   Do not use variables ($ and {} chars) but enter UID and Password enclosed in parenthesis
    (except you have external scripts defining those variables), e.g.:

```
username: -"uid" password: -"pw"
```

❸   Example:

```
url="jdbc:mysql://172.20.50.4:3306/mydb?
```

Remarks above are mandatory for getting Jobsworth running. All remarks below will add e-mail capabilities and may be configured later.

❹   Please fill in host, port and domain as given from your e-mail provider.

To enable the start of Tomcat Servlet container during start of your server, the following entry has to be inserted into your startup configuration file (e.g. /etc/rc.conf)

```
tomcat7_enable="YES"
```

In any browser type in the URL of your Jobsworth server followed by port 8080. For example:

```
http://172.20.50.4:8080
```

If you see the following screen, your Tomcat installation has been successfull.

FIGURE 4.1: **TOMCAT WORKS**

5 E-Mail

When jobsworth sends outgoing emails for task updates, they will have a reply address which looks like this:

```
task-1234@acme.domain.com.au
```

If a user hits reply to that email, you want it to be appended to the task comments. Here's how to set this up for sendmail; adapt the script for your own mail server. Mail can be running on a different server to jobsworth because we use HTTP to push the mail from your mail server to jobsworth.

Sendmail: Add an entry to /etc/mail/local-host-names for your hostname:

```
acme.domain.com.au
```

Add an entry to /etc/mail/aliases to create an alias that will hand off emails to a script:

```
jobsworth: -"|/usr/local/share/jobsworth/mail_script.sh"
```

Add an entry to /etc/mail/virtusertable to redirect all emails to your domain to the above alias

```
@acme.domain.com.au        jobsworth
```

run

```
make; make restart
```

in /etc/mail to rebuild the sendmail databases. Now create a script at /usr/local/share/jobsworth/mail_script.sh with the following contents

```
#!/bin/sh
SECRET=password1234
URL=https://acme.domain.com.au/emails
cat $2 -| -/usr/local/bin/curl --s --k ---data-urlencode secret=${SECRET} ---data-
urlencode email@- ${URL}
```

Make sure you change the password and you make it the same as the password in the context.xml file.

6 Jobsworth

Stop tomcat. With FreeBSD use the following command:

```
service tomcat7 stop
```

Enter Tomcat web-directory e.g.

```
/usr/local/apache-tomcat-7.0/webapps
```

and delete (or better rename) the subdirectory ROOT. Now copy the latest version of Jobsworth installation file ROOT.war (https://github.com/ari/jobsworth/releases) ↗ into the Tomcat web-directory. Finally enable Tomcat again with

```
service tomcat7 start
```

The ROOT.war-file will now be extracted into a ROOT subdirectory. Give it a few seconds to complete before you continue.

> **Tip**
>
> For the installation of any new version of Jobsworth you only have to replace the ROOT.war file.

II Administration

7 Login

After you have successfully managed the installation part, it's time to login and start exploring Jobsworth 4.0.

Open the browser of your choice (currently supported are: Internet Explorer, Firefox, Chrome) and type in the URL of your Jobsworth server followed by port 8080. For example:

```
http://172.20.50.4:8080
```

This will lead you to the following login screen.

Important

The default user after installation is *admin/password* . During first login all database tables will be generated and filled with some initial content. This may take a while. Please stay patient. For security reasons change the password as soon as possible.

8 Menu Items

Jobsworth needs some basic preparation (e.g. project and company setup), before each function can be used. Nevertheless the Author decided to describe the menu in the order it appears on the screen. A kind of workflow may be added later.

8.1 Overview

8.1.1 Dashboard

here we are
